Introduction

Mercury is the visualization and analysis software of the Cambridge Structural Database (CSD). Mercury is used in investigating and analysing crystal structures with features that allows a user to generate packing diagrams, display and assess the strength of intermolecular interaction networks, calculate and display voids, create BFDH theoretical crystal morphologies and more (features availability subject to appropriate licence). With Mercury you can visualize 3D structures from the CSD as well as your own. You can also produce high-quality publication-ready images, frames for videos, and 3D print files.

Before beginning this workshop, ensure that you have installed Mercury. Please contact your site administrator or workshop host for further information.

Learning Outcomes

In this workshop we will see features of Mercury that enable an effective visualization of crystal structures and how to produce high-resolution images. At the end of this workshop, you will be able to:

- Choose visualization options.
- Produce high-quality images.
- Calculate and display packing.

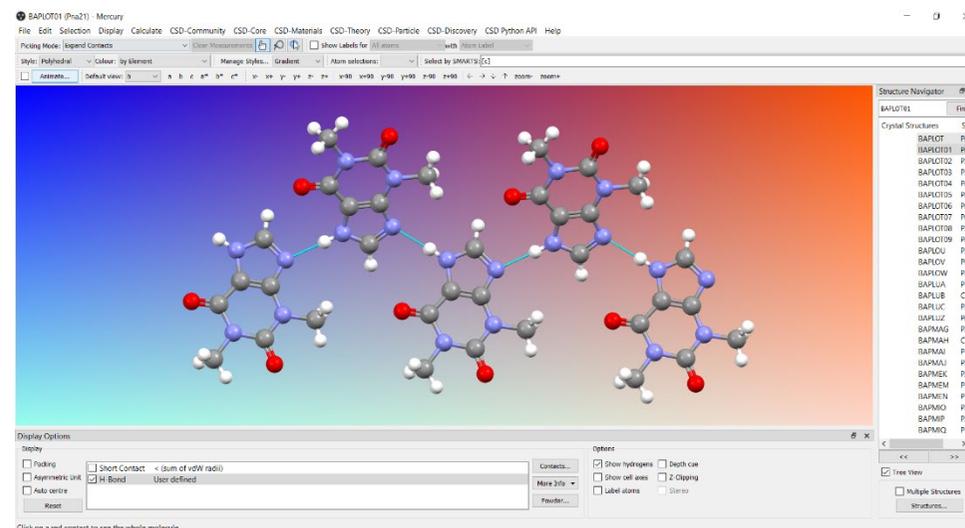

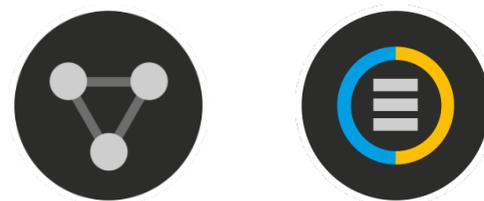

This workshop will take approximately **45 minutes** to be completed. The words in *Blue Italic* in the text are reported in the [Glossary](#) at the end of this handout.

Pre-required Skills

There are no pre-required skills for this workshop.

Materials

There are no additional materials required for this workshop.

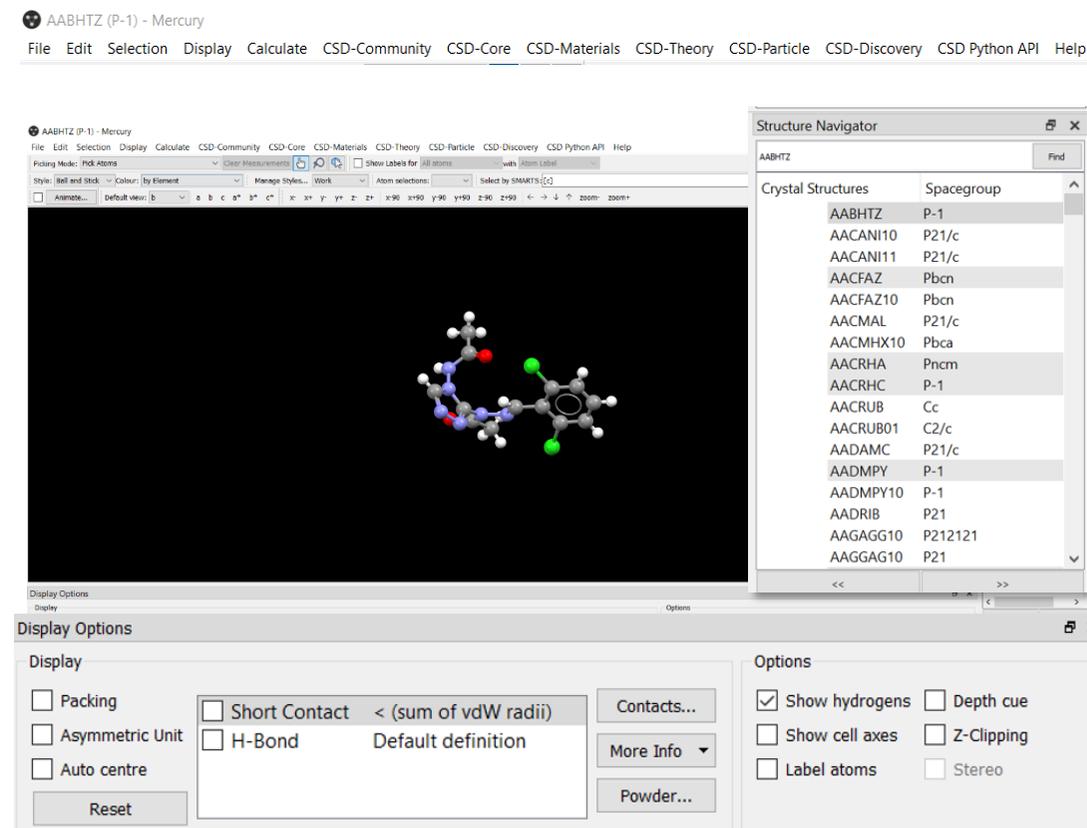

Basics of Mercury Visualization

Mercury is the CCDC's visualization software to view 3D structures of small molecules and to generate images and animations of molecules.

In the following we will see some of the basics of navigation and visualization in Mercury that you will find helpful to support your analysis.

In the **Mercury interface** we find:

- **At the top:** list of menus from which we can access visualization and analysis options, and other CSD components such as CSD-Materials.
- **On the right-hand side:** the **Structure Navigator**, with the database loaded (depending on your licence). The Structure Navigator allows you to select a refcode to visualise in the main Mercury window.
- **Beneath the main display window:** **Display Options** toolbar. You can quickly view a packing diagram, display Hydrogen bonding and detailed information about the molecule using the More Info option.

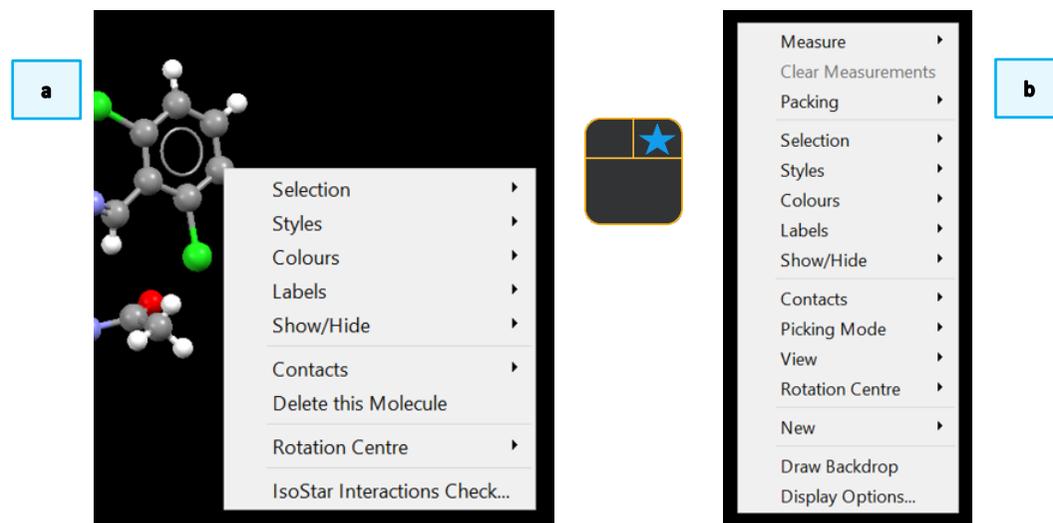

Using the **mouse to enhance visualization:**

-  Left mouse button and move – rotate molecules.
-  Middle Mouse wheel – move molecules up and down.
-  Right mouse button and move up and down – zoom in and out of molecules.
-  Shift + Left mouse button and move - rotate in the plane molecules.
-  Ctrl + Left mouse button and move - translate molecules.

Right click:

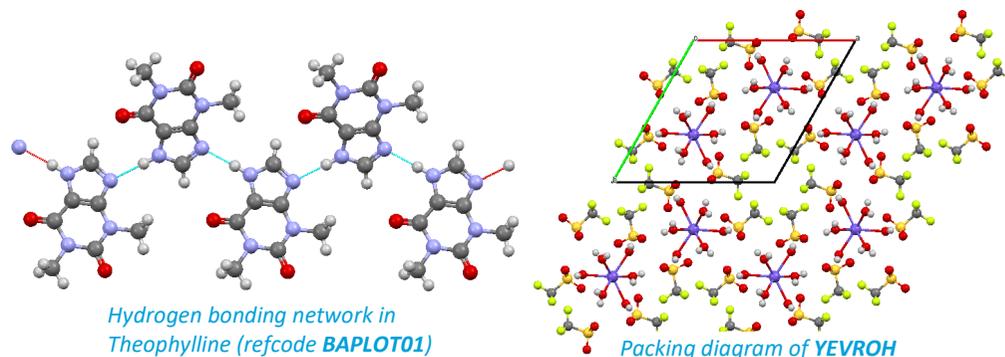

- Near a molecule and
- Away from a molecule

Example 1. Generating Structure Views

To communicate science effectively, researchers must be able to provide clear images of structural models for inclusion in manuscripts and presentations. The program Mercury contains many features which can assist in the production of high-quality, high-resolution graphics of molecules and extended structure.

This example shows you how to build structural views such as packing diagrams, void space, and intermolecular interactions, which can then be output in graphics format for use in various communications. For these examples we will be using entries in the Teaching Subset, however, the following methods can be applied to any entry in the CSD, or any of your own structure files.

Generating a Simple Molecular View

In this section, you will learn how to select style options to generate a simple molecular view.

1. Open Mercury by clicking the desktop icon, or launching from the Start menu, Launchpad (macOS) or command line (Linux).
2. In the **Structure Navigator** window, type the refcode CCXAPT, to bring up the structure of a cisplatin derivative.
3. The whole molecule should be displayed in the viewing window. In the **Display Options** toolbar at the bottom of the Mercury display window, tick the box for *Asymmetric Unit* and you will see half of the molecule disappear. Untick the box to bring back the whole molecule.
4. To generate the view in Step 3 above, choose *Publication* from the *Manage Styles* drop-down menu. Experiment by choosing other styles from this menu.
5. To change the style of the atoms and bonds in the structure, but to keep the white background, use the *Styles* dropdown box. Experiment with this by choosing some other options. You can undo an action by clicking on Edit > Undo. Return to "Ball and Stick" when you are done.

6. The white Pt atom may not stand out against a white background. To change its colour, right-click on the Pt atom and choose *Colours > Purple*. You can choose any colour in the list, depending on your preferences.
7. To change the colours of multiple elements at a time, use the *Element Colour Options* dialog, by right-clicking on any atom and selecting *Colours > Element colours...* from the drop-down menu. To restore the default colours, click "Defaults" in the Element Colour Options box and click Close.
8. To orient the structure, click and drag to rotate in 3 dimensions. Shift-Click and drag left to right or up and down to rotate the structure only in the plane of the screen. Control-Click and drag to translate the structure in the plane of the screen. Experiment with these techniques until you have the view you desire. Press the **Reset** button to return to the original view.
9. If you find that you want to create your own style type, you can access the *Style Manager* dialog by clicking on the **Manage Styles...** button.
10. It is easiest to copy and edit an existing style so we will do that here. Click the "Publication" style and then click **Copy**. Enter a name for your new style in the dialog box and click **OK**.
11. Now, select your copied style from the *Style Manager* list and click **Edit**. This will launch the *Style Settings* dialog box. Here you can change all the display properties associated with this new style type.
12. **Note:** Click the **Display Options...** button to access the style preferences for Labeling. Here you can change the font, font size and colour for labels for your new style. (You can also access this dialog from the top Mercury menu: *Display > Display Options* or *Display > Labels...* for label options only.)
13. Once Labels are finished adjusting your style preferences, click **OK** to save them. Click **Close** to exit the *Style Manager* dialog box. You can now access this style from the *Manage Styles...* dropdown menu.
14. You should now be able to create a structure view with your preferred styles.

The image contains several screenshots from the Mercury software interface, each annotated with a number in a blue box:

- 6:** A context menu is open over a Pt atom in a ball-and-stick model. The 'Colours' option is selected, and 'Purple' is chosen from the list.
- 7:** The 'Element Colour Options' dialog is shown. The 'Defaults' button is highlighted.
- 8:** The 'Display' dialog is shown. The 'Reset' button is highlighted.
- 9:** The 'Style Manager' dialog is shown. The 'Manage Styles...' button is highlighted.
- 10:** The 'Style Manager' dialog is shown. The 'Publication' style is selected, and the 'Copy' button is highlighted. A 'Style name' dialog box is open with 'Publication Copy' entered.
- 11:** The 'Style Manager' dialog is shown. The 'Publication Copy' style is selected, and the 'Edit' button is highlighted. The 'Style Settings' dialog is also visible.
- 12:** The 'Display Options' dialog is shown. The 'Labels' section is selected.

Generating Ellipsoid and Polyhedral Views

In this section, you will learn how to generate ellipsoid and polyhedral views. Displacement ellipsoids can be displayed for structures where the structure file contains *Atomic Displacement Parameter* Values. For Polyhedral displays, the “Central Elements” refers to the atoms around which the polyhedra are centred and “Ligand Elements” are the neighbouring atoms which create the corners of the polyhedron.

1. In the **Structure Navigator** window, type the refcode BIMXOK, to bring up the structure of mer-trichloro-tris(cyclopentanone oxime)-rhodium(iii).
2. Choose *Publication* from the *Manage Styles* dropdown menu.
3. To change the style of the atoms and bonds in the structure, use the *Styles* dropdown box. Select “Ellipsoid”.
4. We can take a closer look at the settings for Ellipsoid style. Right-click in the main window, Select *Styles* > *Ellipsoid settings...*
5. Click on the “Draw principal ellipses” box to show the principal ellipses. The default colour is black, change the colours to see how it changes the look of the molecule. The hydrogen spheres are set to 0.30 (Å), click in the Draw hydrogens box to change the radius. The bond style can be changed from Stick to Wireframe or adjust the scale to vary the thickness of the bond. The default values in the settings are adequate for this workshop. When you are ready to continue, click **Defaults** and click **Close** to exit the Ellipsoid Display Options window.
6. The molecule pictured in 5 shows the principal ellipses and wireframe bond style. The figure in 6 uses the default ellipsoid settings.

Now we are going to generate a polyhedral view of the mer-trichloro-tris(cyclopentanone oxime)-rhodium(iii) complex. Before applying the style, **can you predict where the polyhedral corners would reside in this complex?** Your current view should be figure 6.

The figure consists of six numbered screenshots illustrating the steps to generate an ellipsoid view of a molecular structure:

- 1**: Structure Navigator window showing the search for 'BIMXOK' in the Crystal Structures list.
- 2**: Manage Styles... dropdown menu with 'Publication' selected.
- 3**: Picking Mode: Pick Atoms dropdown menu with 'Style: Ellipsoid' selected.
- 4**: Context menu with 'Ellipsoid settings...' selected.
- 5**: Ellipsoid Display Options dialog box. The 'Probability level (%)' is set to 50. Under 'Display options', 'Draw principal ellipses, in colour:' is checked. 'Draw hydrogens as fixed-size spheres, of radius (Å):' is set to 0.30. 'Draw Non-Positive-Definite atoms as cubes' is checked. 'Bond style:' is set to 'Stick' and 'Radius (Å)' is set to 0.06.
- 6**: Two views of the molecule. The left view shows the structure with principal ellipses and wireframe bonds. The right view shows the structure with the default ellipsoid style.

7. To change the style of the atoms and bonds in the structure, use the *Styles* dropdown box. Select Polyhedral

8. The polyhedral display depends on the definition of the “Central Elements” and “Ligand Elements”. We will look at these definitions in the Polyhedral Settings. Right-click in the main window, Select Styles > Polyhedral settings...

9. Click on Central Elements to see which elements are included in this definition, click **Cancel** to return to the Polyhedral Display Options window. Click on Ligand Elements to see the defined elements for ligands. The default definitions are adequate so click **Cancel** to return to the Polyhedral Display Options window.

10. In the Polyhedral Display Options window, untick the box for **Draw edges** to see the effect on the display. Next, change the Opacity by clicking and dragging the slider to the left. You are now able to see the central element. The colour of the polyhedron depends on the colour of the central atom. You can change the colour by right-clicking on the polyhedron > Colours. Note that the central atom should be selected, you can see the central atom clearer if you adjust the opacity first. Changing the colour of the Polyhedron will also change the colour of the central element. Once you are satisfied with the look of the complex, click **Close** to exit the Polyhedral Display Options window.

11. You should be able to create Ellipsoid and Polyhedral views for complexes. Remember, Ellipsoid style depends on the inclusion of certain parameters in the structure file or deposited entry. Polyhedral style depends on the inclusion of the central element in the Polyhedral Display Options.

Generating a Packing Diagram

In this section, you will learn how to generate a packing diagram of a structure.

1. In Mercury, type the refcode **YEVROH** in the **Structure Navigator** toolbar.
2. This will display the metal-organic salt compound, nona-aqua-curium(iii) tris(trifluoromethanesulfonate) which crystallises in the space group $P6_3/m$. Tick and untick the *Asymmetric Unit* box to see what atoms are generated by symmetry (Step 3 in Generating a Simple Molecular View above).
3. Tick the *Packing* box in the **Display Options** toolbar to generate a packing diagram.
4. To change the settings of the packing diagram, choose *Calculate > Packing/Slicing* from the top menu. This will launch the *Packing and Slicing* dialog box.
5. The top half of this window contains the packing preferences. Click the radio button next to “...in molecules where Any atom fits” and see how this changes the packing diagram in the Mercury window. Notice how two more metal-hydrate complexes appear in the center of the view and triflate anions appear at the edges.
6. To change the range of the packing diagram along any individual axis, click the **+ 0.5** buttons by the corresponding axis. Or type a specific range in the text boxes. This example is -1.0 to 2.0 along the *b* axis.
7. Alternatively, click the **2x2x2** or **3x3x3** buttons to make an expanded packing diagram along all three axes at once.
8. To orient the view along the crystallographic *c* axis, click the **c** button just above the viewing window.
9. When you are done, click the **OK** button at the bottom of the *Packing and Slicing* dialog box to exit.

The figure consists of eight numbered screenshots illustrating the steps to generate a packing diagram in Mercury:

- 1**: Structure Navigator toolbar with the refcode **YEVROH** entered in the search field.
- 2**: A 3D ball-and-stick model of the molecule, nona-aqua-curium(iii) tris(trifluoromethanesulfonate).
- 3**: The Display Options toolbar with the **Packing** checkbox checked.
- 4**: The top menu bar showing the path **Calculate > Packing/Slicing...**.
- 5**: The **Packing and Slicing** dialog box. The radio button for “...in molecules where Any atom fits” is selected.
- 6**: The packing diagram is expanded. The **b** axis range is set to -1.0 to 2.0.
- 7**: The packing diagram is further expanded using the **2x2x2** and **3x3x3** buttons.
- 8**: The packing diagram is oriented along the crystallographic **c** axis.

Displaying Intermolecular Contacts

This example will show you how to display hydrogen bonds and short contacts in a crystal structure.

1. In Mercury, type the refcode **BAPLOT01** in the **Structure Navigator** toolbar to load the structure of theophylline into the viewer. Click **Reset** to restore the view to the default (i.e., no packing) arrangement.
2. To see if theophylline exhibits any hydrogen bonds, tick the box next to H-Bond in the **Display Options** toolbar. Now you will see red dashed lines indicating hydrogen bonding interactions to nearby atoms.
3. Click each atom to generate the complete molecule. Keep doing this until you have generated a network of 4 or 5 molecules.
4. Once you have a nice hydrogen-bonded chain of molecules, right click the red dashed lines and choose *Delete Hanging Contacts* to remove these dangling bonds. Click *Reset* in the bottom left corner to return to the default view.
5. Now type the refcode **CAFINE** in the **Structure Navigator** toolbar. This will load caffeine hydrate in the viewer.
6. We want to know if there are hydrogen bonding interactions to the water molecule, but this crystal structure does not include the hydrogen atoms on this water. Tick the box next to H-Bond and contacts might not appear.
7. To see hydrogen bonding contacts without hydrogen atoms present, double click the row for H-Bond to access the *Define H-Bonds* dialog window. Make sure the box next to "Require hydrogen atoms to be present" is unticked and then click **OK** to exit the window.
8. Now you will see hydrogen interactions between the caffeine and water molecules. Follow steps 3 and 4 above to generate the hydrogen bonding network.

Example 2. Generating Images and 3D Print Files

There are many ways to visualize the structure views created in Mercury, including high-resolution static views, animated rotating images, and 3D printed models. Each of these formats has its place in manuscripts, lecture presentations, websites, and tactile classroom displays.

The following exercises will show you how to generate high-resolution graphics files, the files needed to produce an animated rotating GIF, and files that can be sent to a 3D printer to produce a structural model directly from Mercury.

High-resolution POV-Ray image (left) and 3D printed model (right) of fullerene (refcode: FULLER).

High-resolution images

POV-Ray, or Persistence of Vision Raytracer, is a program which can be used to create very high-resolution and stylistic images. This example is not a definitive guide to POV-Ray but will show you how to create a high-resolution image *via* the POV-Ray plug-in in Mercury.

1. Open Mercury by clicking the icon or launching from the start menu.
2. In the **Structure Navigator** window, type the refcode CCXAPT, to bring up the structure of a cisplatin derivative.
3. Change colours and styles as in previous examples to obtain your desired view. Make sure the image appears in Mercury exactly how you want it to appear in your manuscript or presentation. Here the colours of the Pt and Cl atoms have been changed, and the molecule rotated to a new orientation.
4. From the top menus, choose *File > POV-Ray Image...* to launch the **POV-Ray Image** dialog box. The upper section of this window includes information on the resolution and style of the POV-Ray generated image. The bottom section includes a path to the POV-Ray executable and an Output directory. You should not need to change the POV-Ray executable location, but you may want to change the Output Directory location. Click **Browse...** to do this.

The screenshots illustrate the workflow for generating a high-resolution image in Mercury:

- Step 1:** The Mercury application icon is shown.
- Step 2:** The Structure Navigator window is open, and the refcode 'CCXAPT' is entered in the search field.
- Step 3:** The resulting 3D model of a cisplatin derivative is shown, with Pt and Cl atoms highlighted in green and purple.
- Step 4:** The File menu is open, and 'POV-Ray Image...' is selected. The POV-Ray Image dialog box is shown, with settings for Width (1024), Height (768), File Format (PNG), and Background (As Mercury). The Output Directory is set to 'D:\output', and the 'Browse...' button is highlighted.

- Change the *Material Properties* to the desired setting by clicking in the dropdown box and clicking the appropriate type. Select *Transparent* from the *Background* dropdown menu. Leave all other default values the same.
- For complicated or large images, or on slow computers, POV-Ray may take a while to create the image file. Click **Preview** to check what the image will look like before rendering the full-size file. The POV-Ray window will briefly appear as the rendering proceeds.
- When you are satisfied with the output, click **Render** to create the file. You can find the .png file in the output directory shown in the bottom of the window. A .pov file is also generated and can be opened with POV-Ray.exe.
- Using different *Material Properties* creates different image styles. Try different materials to see the effects.

Generating Rotating Images.

For presentations or websites, you may want to display a rotating image of your molecule, to highlight stereochemistry, or other spatial effects that are not obvious in static images. This section will show you how to generate images that can be used to make animated (rotating) molecule graphics.

- To see how the rotation will look, click the **Animate...** button in the Mercury window. Tick the box next to **Rotate** and select the radio button for the “y” axis. This will start the molecule rotating in the Mercury viewer. Select different axes (one at a time) and note how the molecule rotates.
- Once you have decided on the orientation of your molecule and the axis of rotation, return to the **POV-Ray Image** dialog box. Tick the box next to “Generate Animation Frames.” Now specify the axis of rotation (x, y, or z) and the “Number of Frames” to generate. The structure will always rotate through 360 degrees, so the higher number of frames, the higher the “resolution” of the rotating image. The default value of **30** is typically a good compromise between file size and resolution. Click **Render** to generate the 30 images. This may take a long time depending on your computer speed.

11. The series of images will be saved in their own folder in your specified output directory. There are many web-based applications which can be used to convert a series of images into an animated GIF.

Generating a 3D Print Model File

Making 3D printed models of crystal structures can highlight interesting features of the molecules as well as help explain many chemical and crystallographic concepts. This section shows you how to create the files used by 3D printers to make 3D objects.

12. To make a 3D print model file, simple choose the structure you want from the **Structure Navigator** or upload your own 3D coordinate file (e.g. CIF, RES, PDB, etc.). For this example, we will load **SUCROS01** for sucrose.

13. For 3D models, the orientation is not important. However, most 3D models work best when the cylinders for bonds are thicker than normal graphics. From the *Manage Styles...* dropdown menu, choose **3D Print** and notice how the bonds become thicker.

14. To edit these settings, right-click an atom or bond in the molecule and choose *Styles > Ball and Stick settings...* This will launch the **Ball and Stick Display Options** dialog window. Leave the defaults for now, and click **Close** to exit.

15. To generate the file, from the top menu choose *File > Print in 3D*. This launches the **3D Printing** dialog window.

16. In the **3D Printing** dialog window, click the *File Format* dropdown menu to choose either STL (monochrome) or VRML (colour) formats, depending on the type of printer you have and the type of model you wish to make.

17. If we had more than one molecule in our structure, or a particularly long and unstable molecule, we might wish to *Generate a Support Framework* by ticking this box. Leave it unchecked for now.

18. Click **Generate** to save the file to the specified folder. Click **Close** to exit.

Summary

This workshop introduced the Mercury interface and some basics of structure visualization. As this was a brief introduction into the graphics and visualization options in Mercury, we recommend further exploration of the interface. After working through this workshop, you should now be familiar with:

- The Mercury interface and exploring options and functions.
- Changing between different visualization options, selecting styles and colours to display your structure of interest effectively.
- Creating publication-ready high-quality images, selecting resolution, material, and background.
- Calculating and displaying the packing of a crystal structure, and the asymmetric unit.
- Creating your own style (or styles), with settings defined by you to make more effective images fitting your structure visualization needs.

Next Steps

The Mercury user guide and other available Mercury documents can be accessed from the [documentation and resources area](#). There is an intermediate level Mercury self-guided workshop (MER-005) that can be found [here](#).

Feedback

We hope this workshop improved your understanding of Mercury and you found it useful for your work. As we aim to continuously improve our training materials, we would love to get your feedback. Click on [this link](#) to a survey, it will take less than 5 minutes to complete. The feedback is anonymous. You will be asked to insert the workshop code, which for this self-guided workshop is MER-001. Thank you!

Glossary

Asymmetric unit

The asymmetric unit is the smallest part of a crystal structure from which the complete structure can be built using space group symmetry.

The asymmetric unit may consist of only one molecule or ion, part of a molecule, or several molecules that are not related by crystallographic symmetry. (This is why you sometimes see more than one molecule in Mercury when you first display a structure from the Cambridge Structural Database.)

Atomic Displacement Parameters (ADPs)

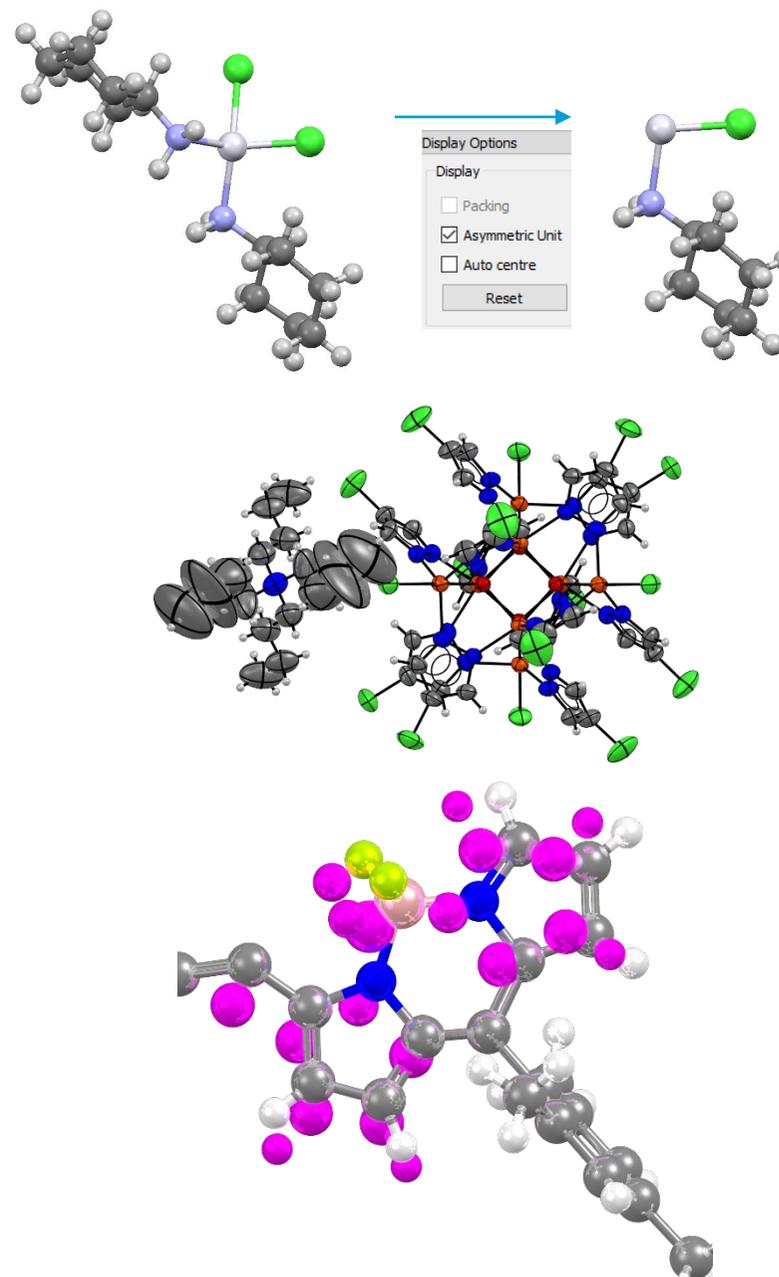

Atomic Displacement Parameters (also known as *atomic vibration parameters* and *thermal parameters*) are used to generate displacement ellipsoids. Displacement ellipsoids represent atomic motion and can be either isotropic or anisotropic. The shape and size of ADPs can be used to highlight potential errors with the data; the smaller and more spherical the ellipses for anisotropic atoms, the better the data (see *Troublesome Crystal Structures: Prevention, Detection and Resolution*, R. L. Harlow, *J. Res. Natl. Inst. Stand. Technol.*, 101(3), 327, 996).

Suppressed Atoms

In Cambridge Structural Database (CSD) structures one or more atoms may be suppressed. A common example is when the author reports two sets of atomic coordinates, for major and minor sites, in a disordered structure. In most cases the atoms of the minor site will be suppressed.

Disordered Structures

Disordered structures display a lack of regularity. For example, each of the F atoms in a trifluoromethyl group, $-\text{CF}_3$, might be randomly distributed between two sites. This means that the crystallographer will report two sets of coordinates for each F atom. In some cases, two alternative sites are occupied equally; in other cases, there is a major site and a minor site. Disorder can involve more than two sites and it can also involve a whole molecule. Disordered structures in the Cambridge Structural Database may have been treated in one of two ways. In older structures, only one position is kept for each disordered atom. When such a structure is read into Mercury, it will therefore appear as if it is not disordered at all. In more recent structures, all positions of disordered atoms are kept but only one set is connected by bonds to form a complete molecule. When a

Suppressed atoms of PIYDEI are in pink.

structure like this is displayed in Mercury, it will have the appearance of a complete molecule with disconnected atoms at various points to indicate alternative sites for the disordered atoms.

Unit cell

The unit cell is the basic building block of a crystal, repeated infinitely in three dimensions.
